

Decomposing Activities of Daily Living to Discover Routine Clusters

Onur Yürüten*, Jiyong Zhang**, and Pearl Pu*

*Human Computer Interaction Group, **Artificial Intelligence Laboratory
Computer & Communication Sciences I&C, École Polytechnique Fédérale de Lausanne

Objectives

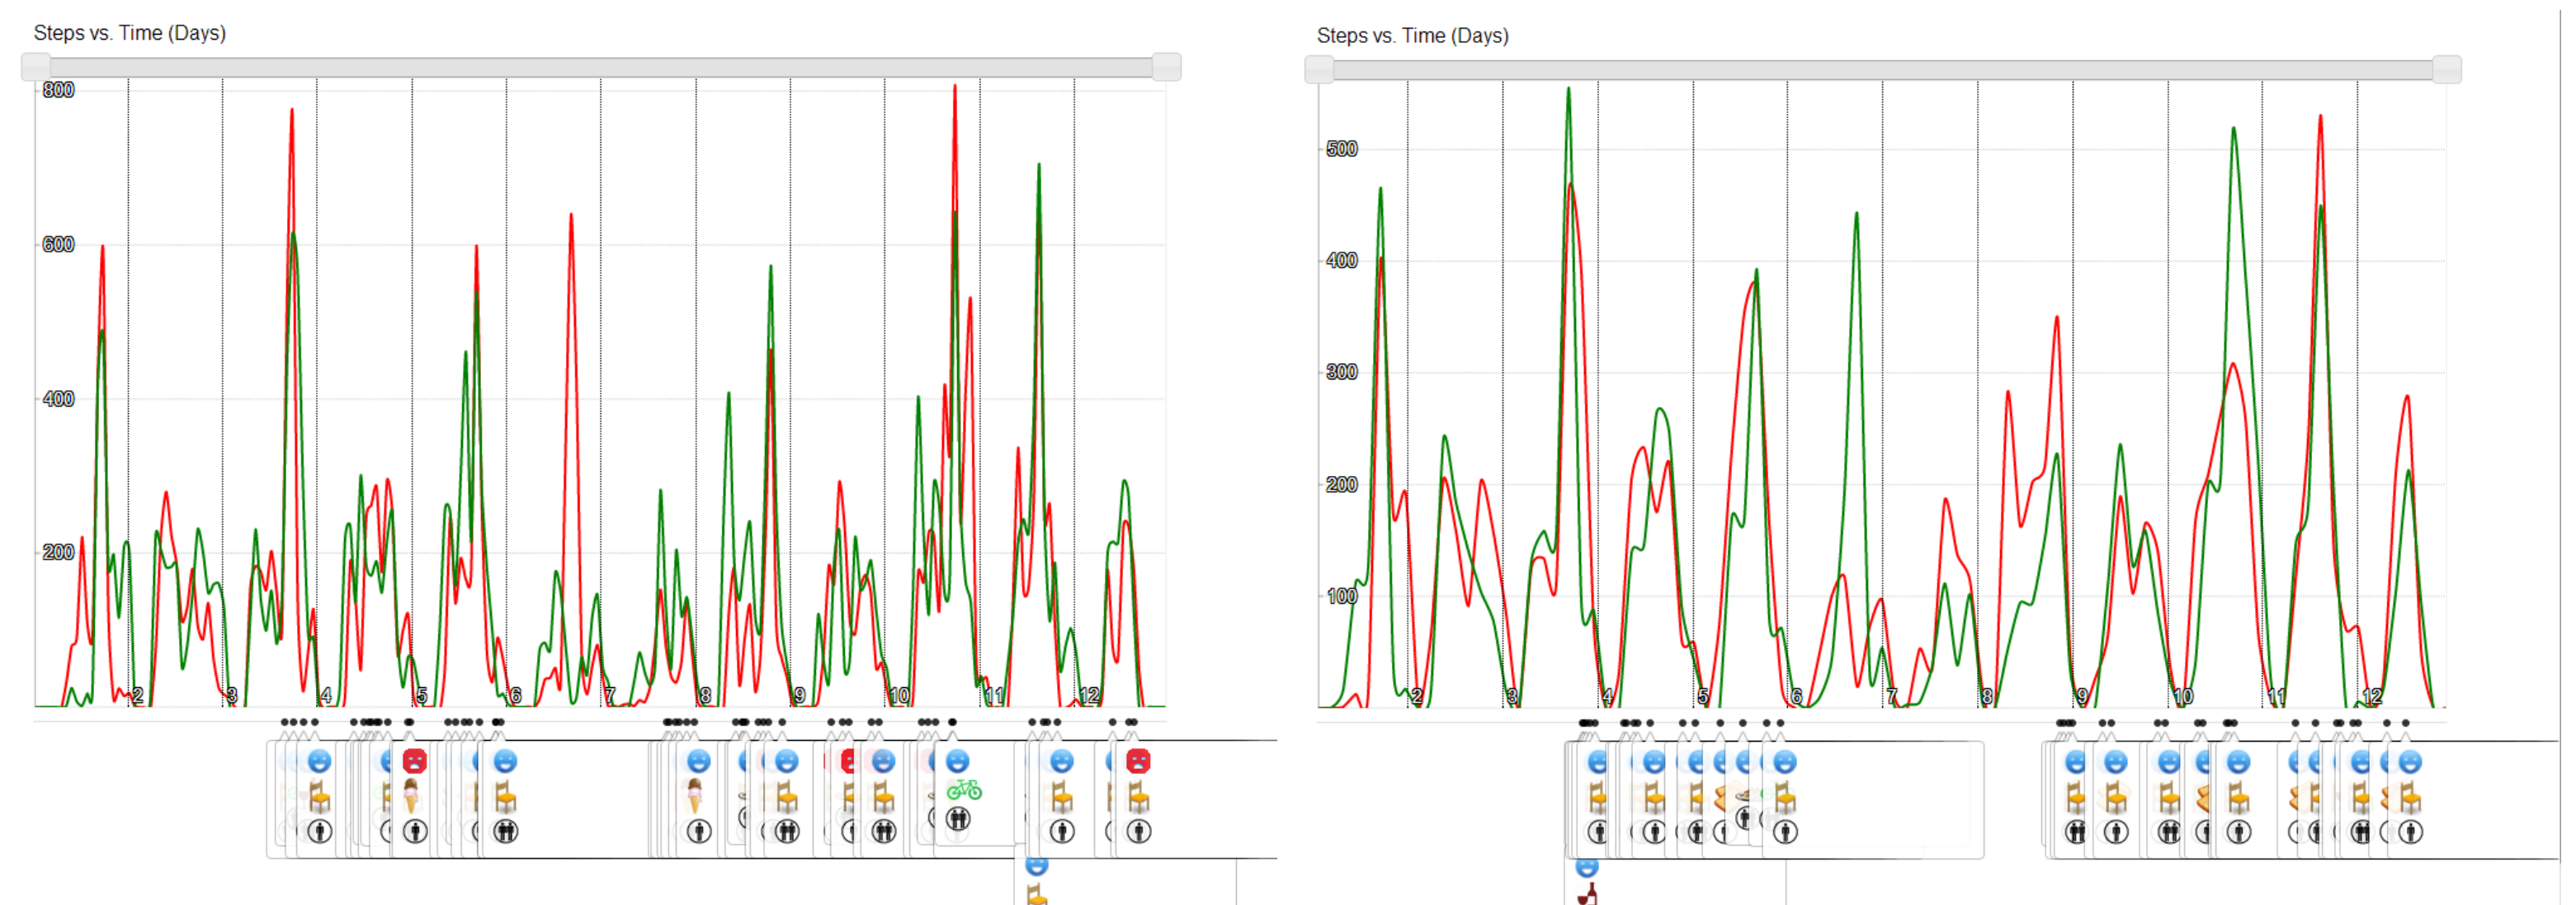

- Gain insight from activities on a macro scale
- Capture common routines for elaborate statistical analysis
- Provide directions for delivering personalized recommendations with lifestyle recommenders

Motivations

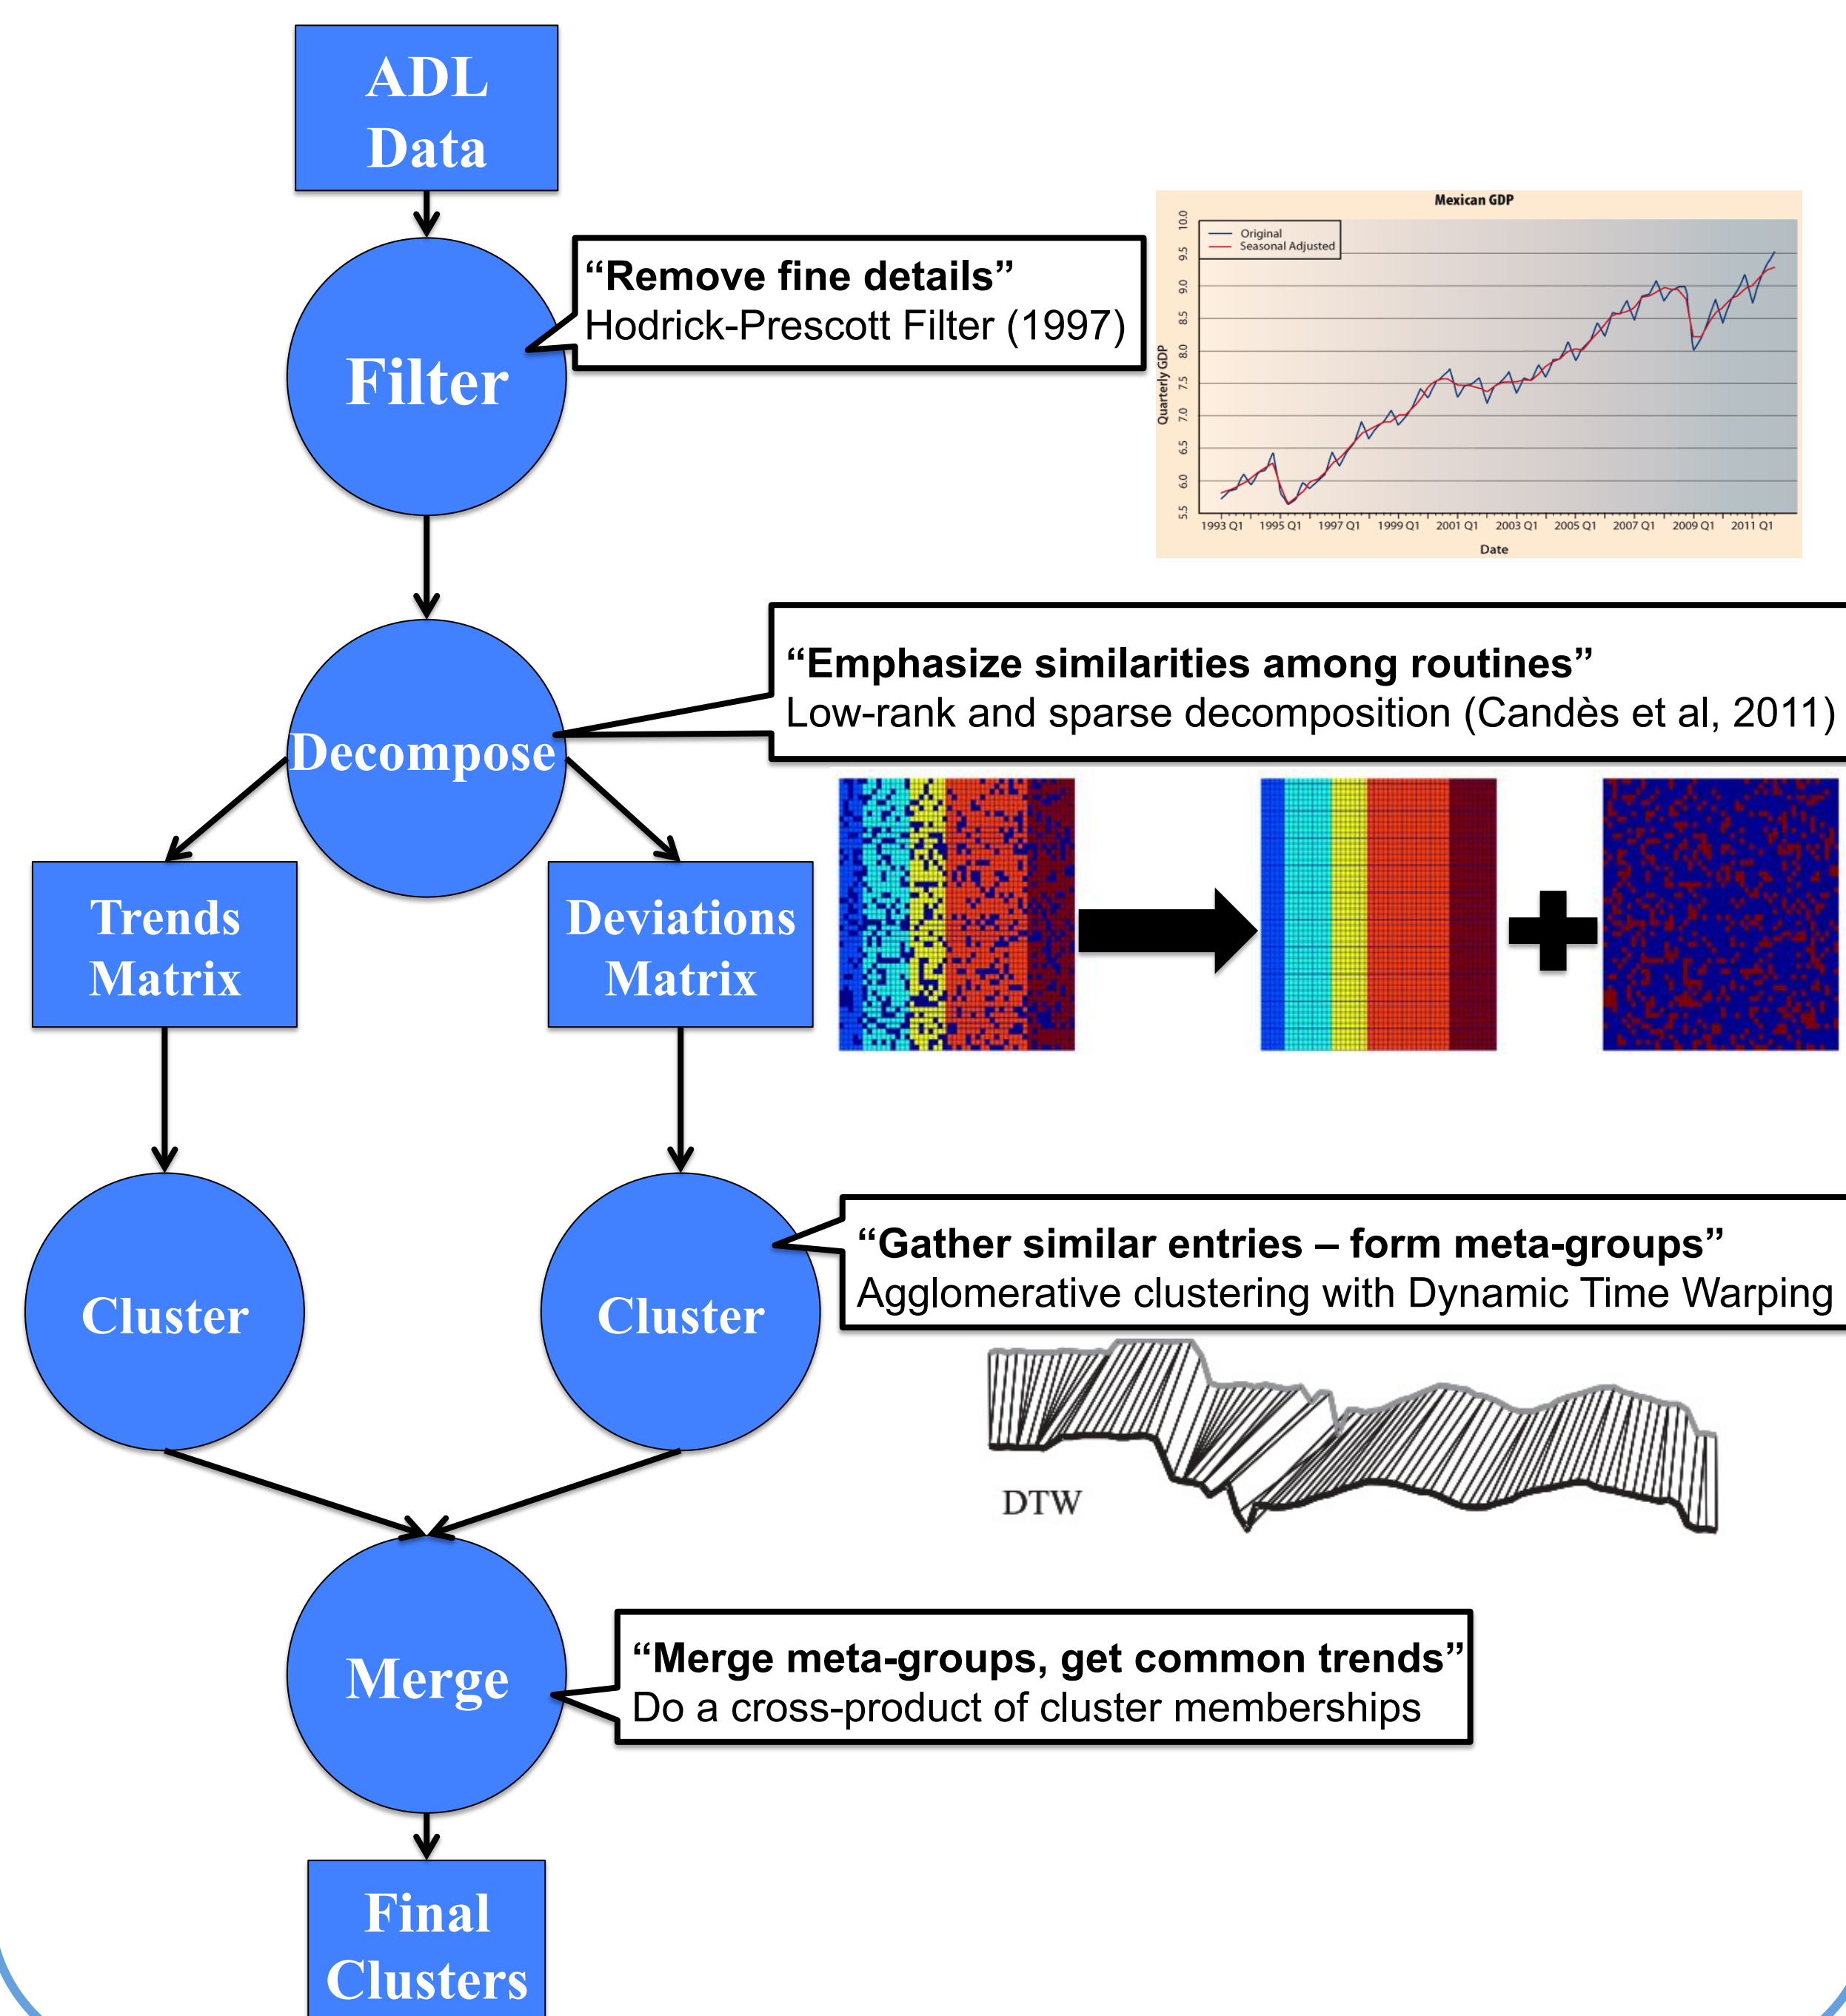

People adopt routines:

- **Minor** differences, **major** similarities each day.
- Possibility to describe common characteristics: Early-morning people, night people, hikers, daily commuters,...

Trends of some example people that resemble their “exercise buddies”:

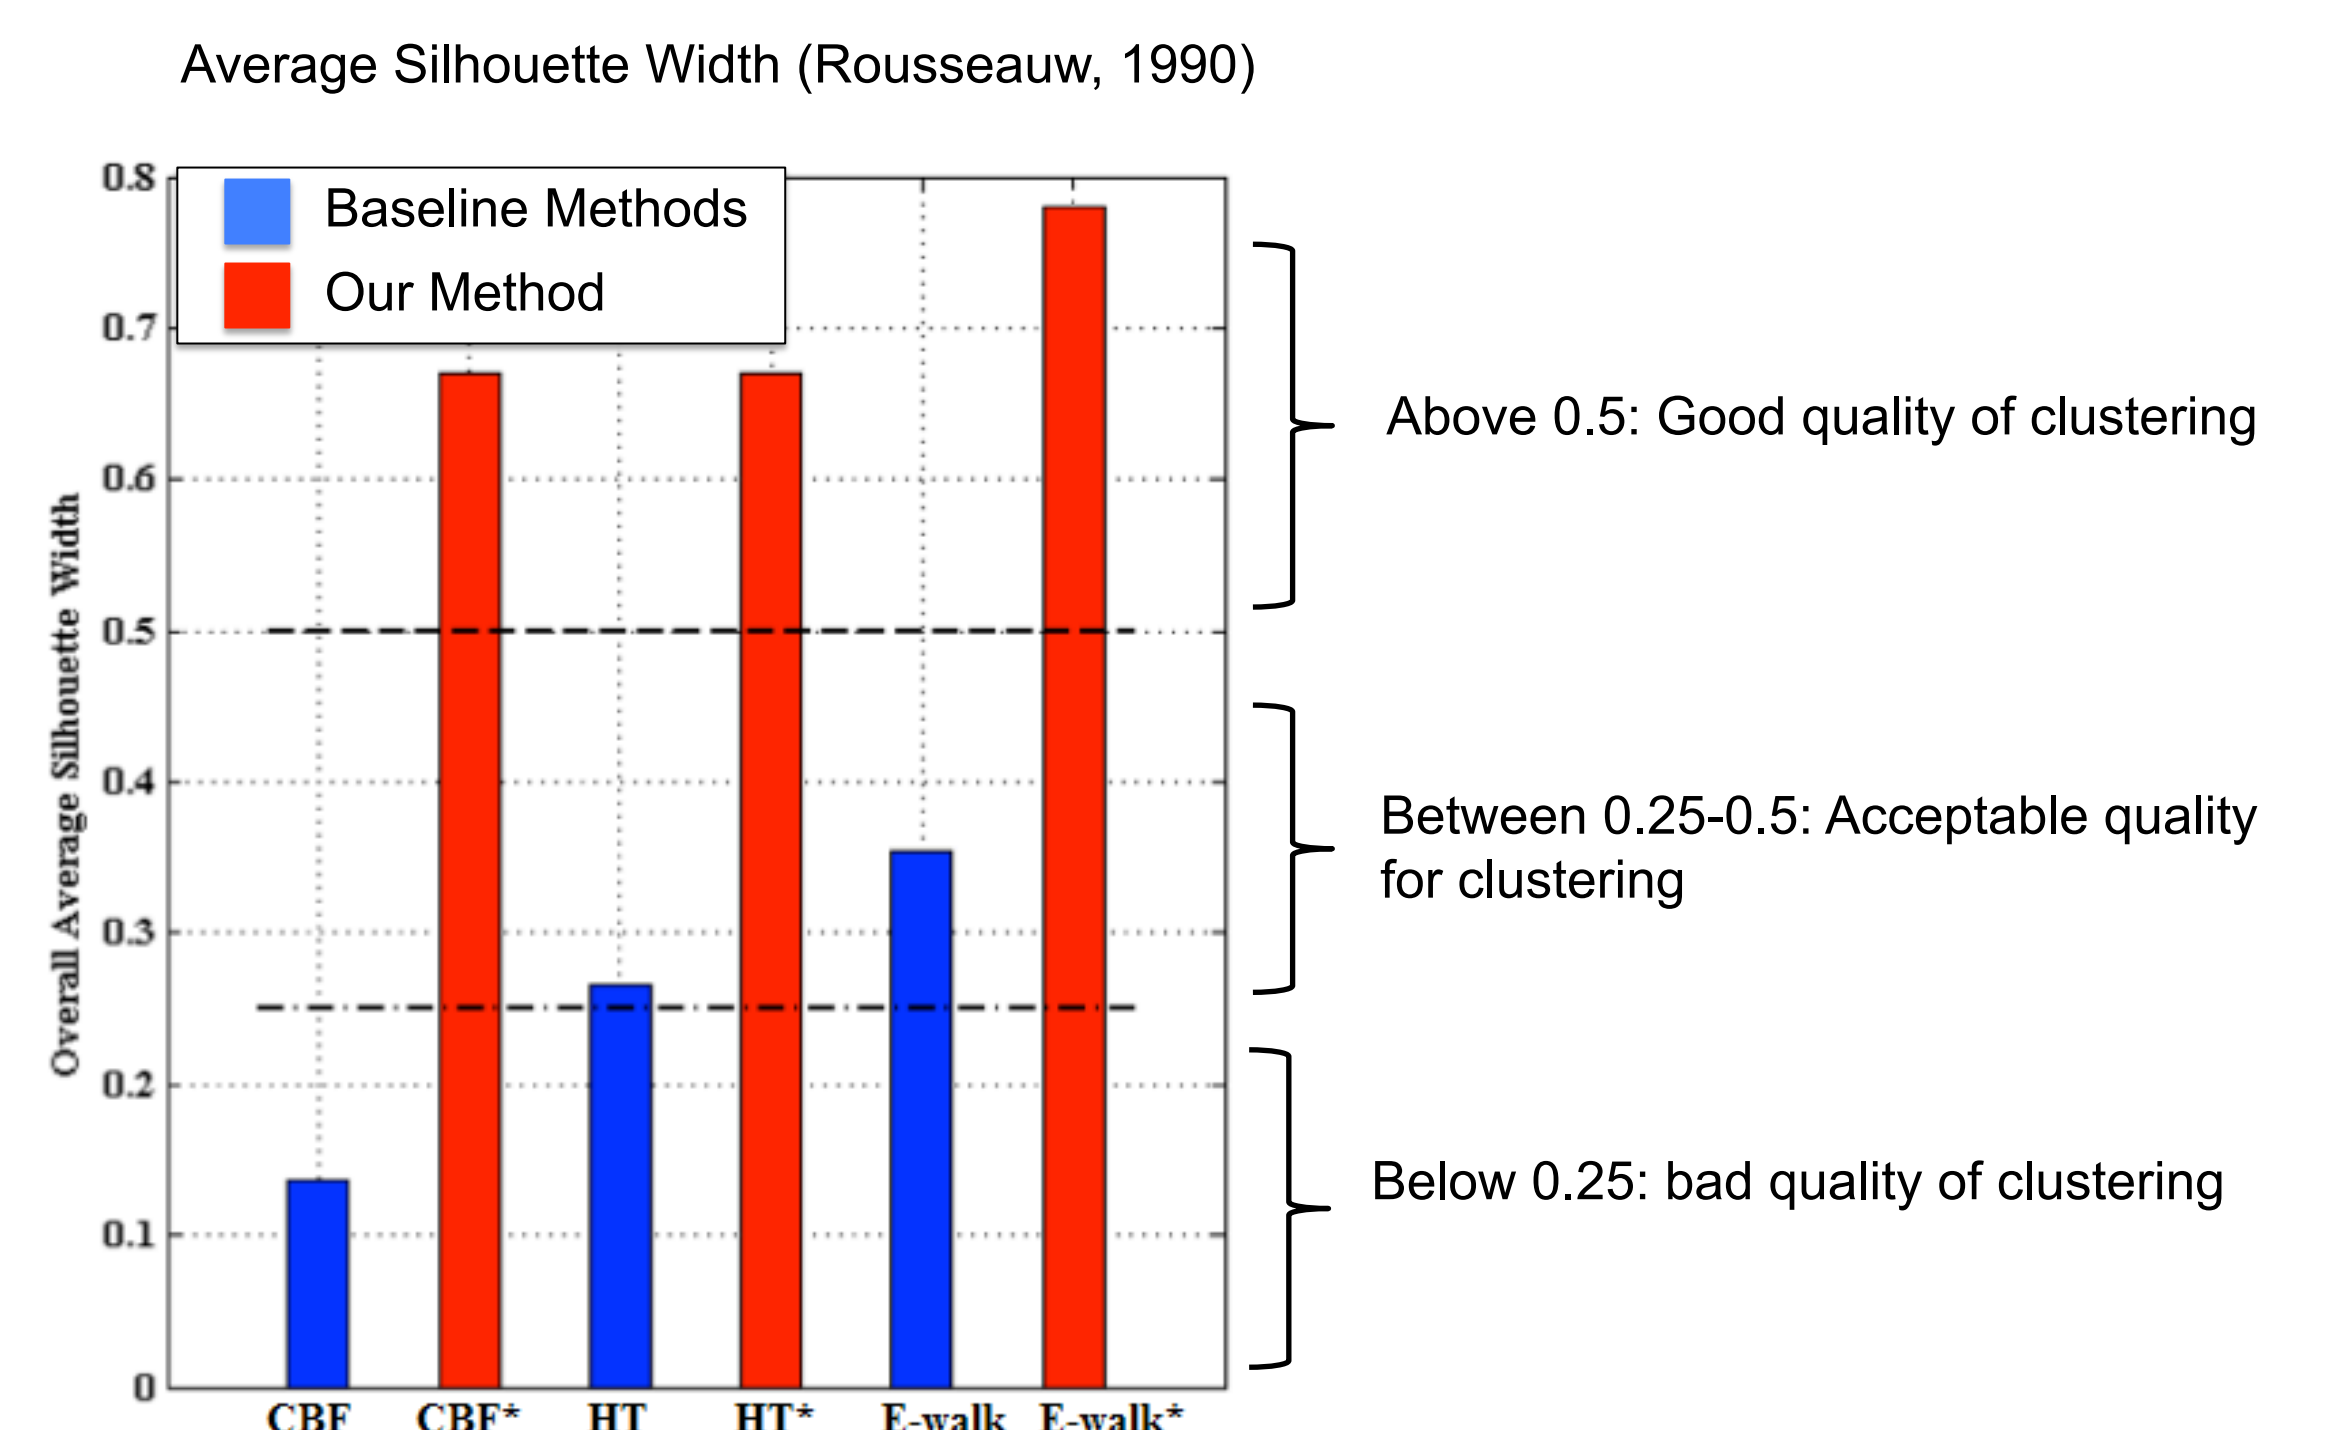

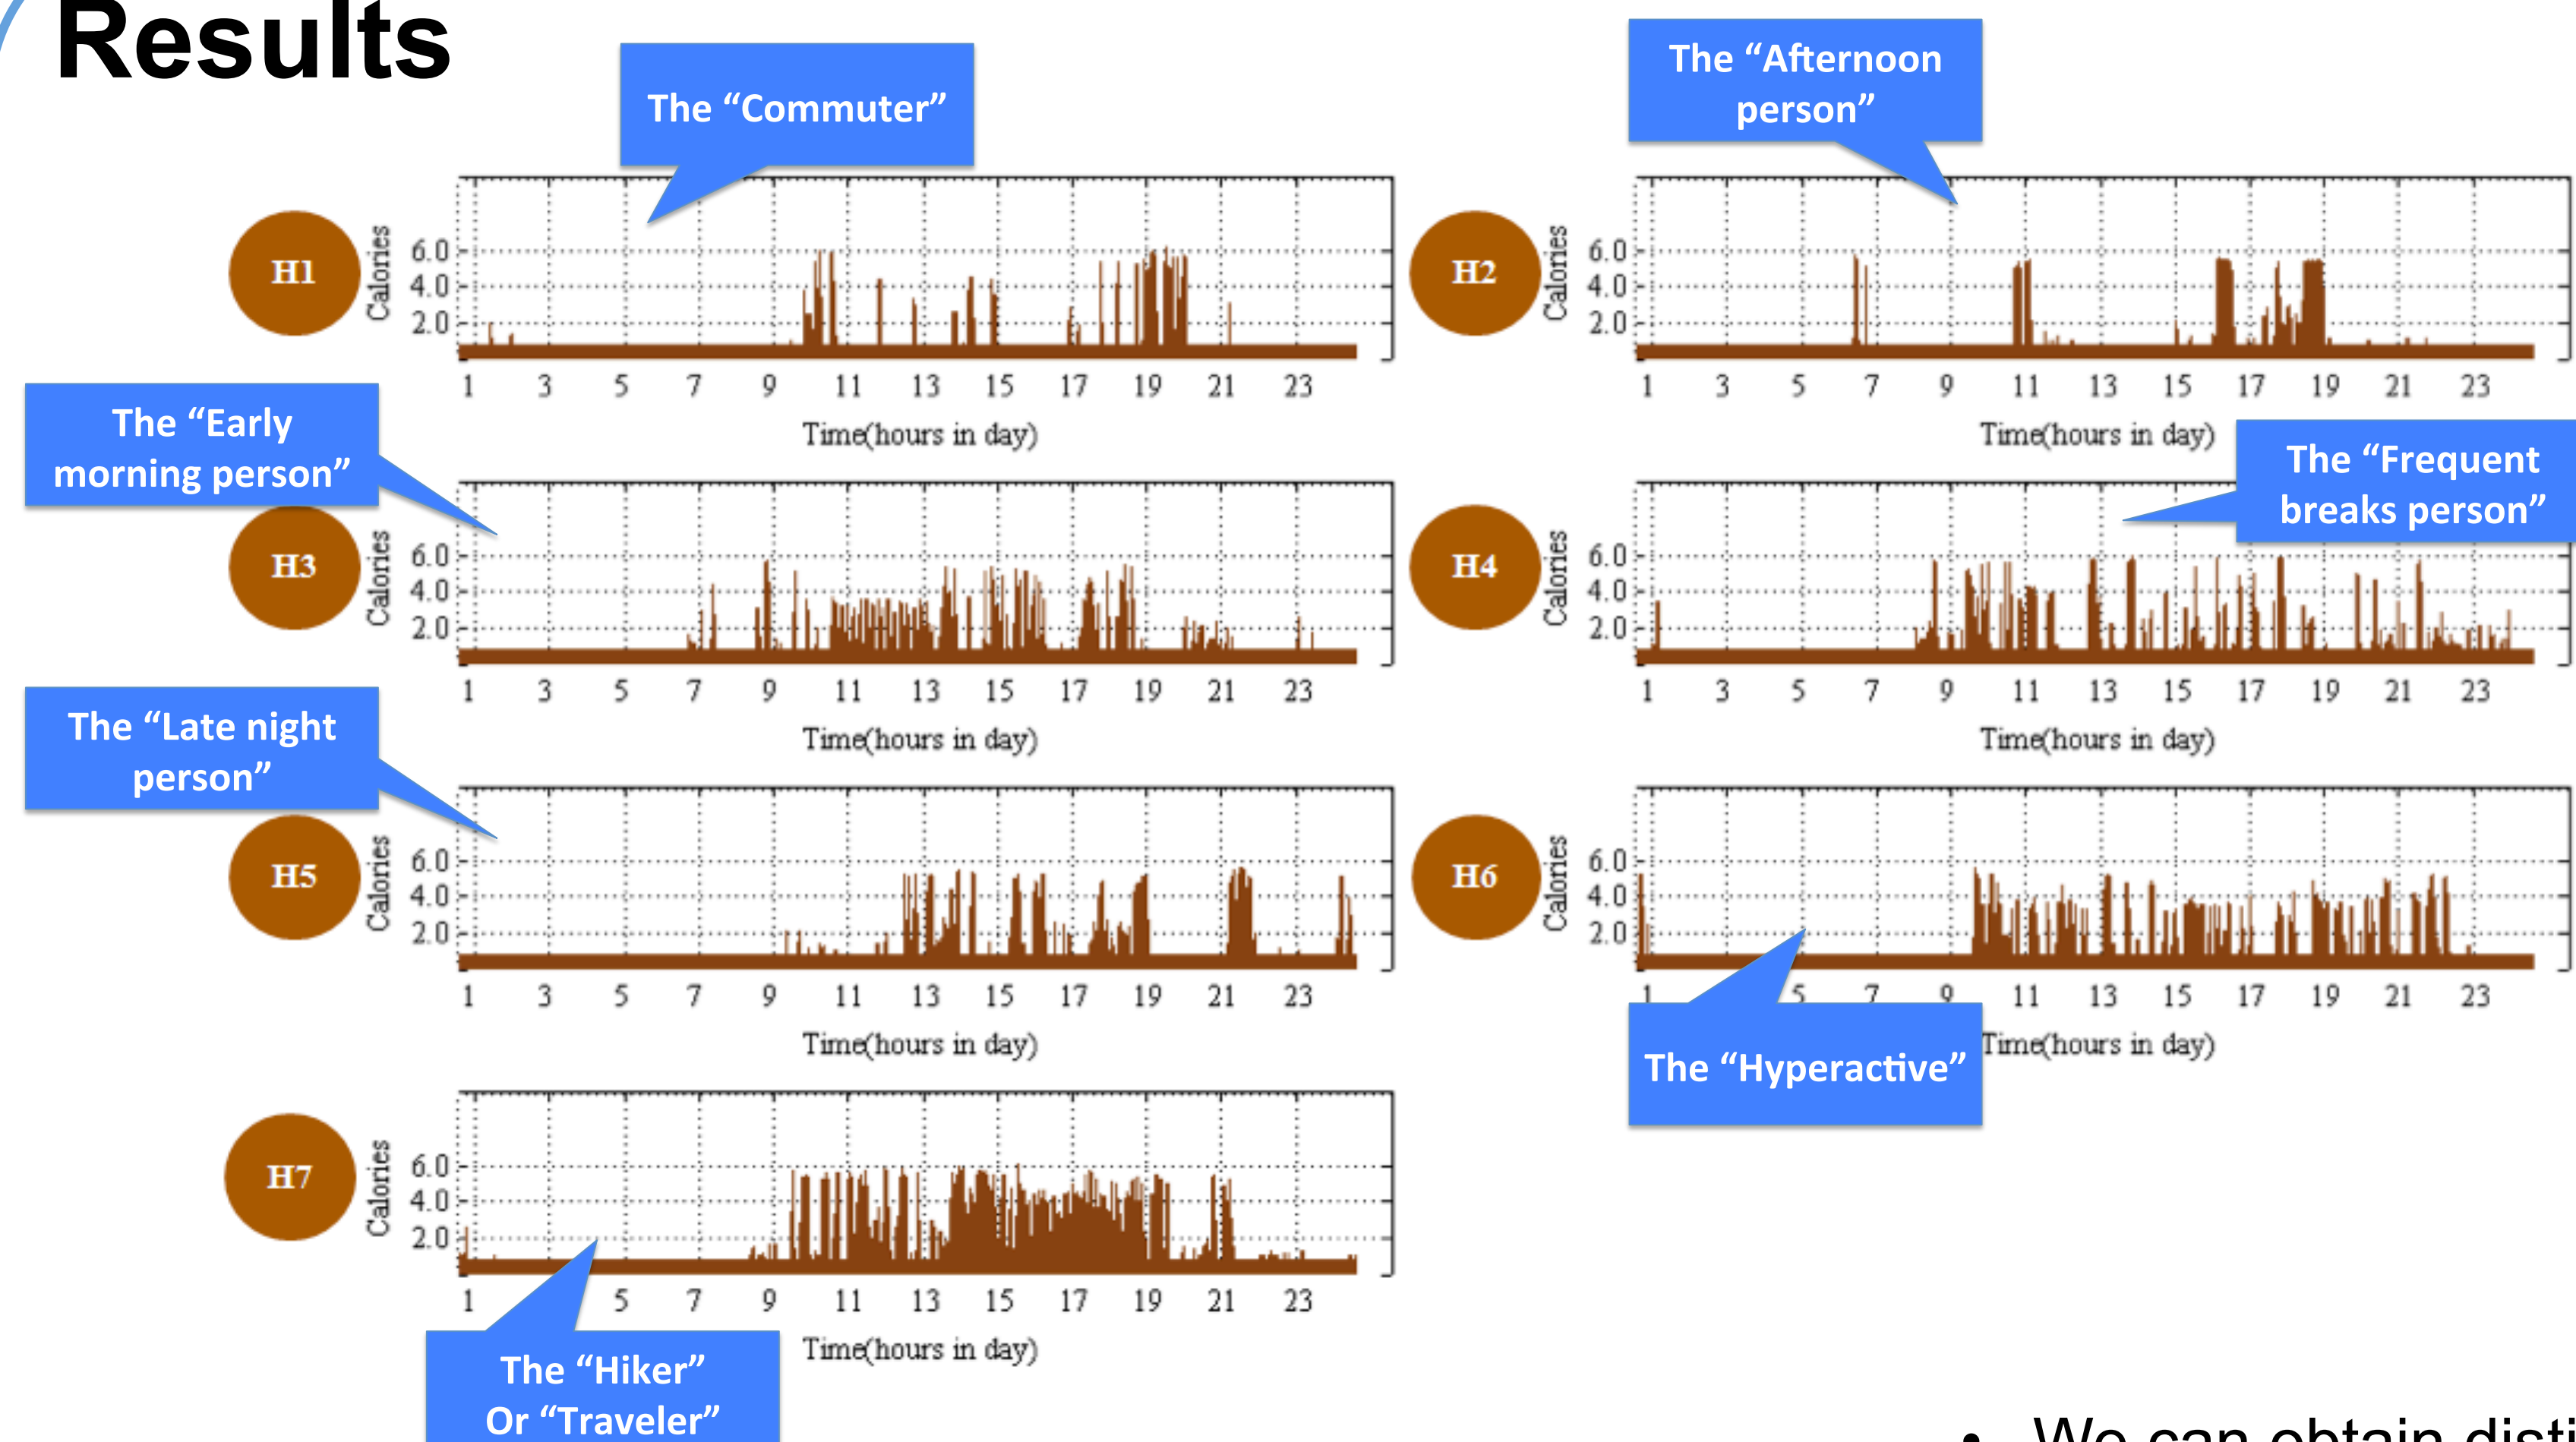

Method

Datasets

- **Cylinder-Bell-Funnel** (Keogh and Kasetty, 2002)
 - 256 artificial entries, 256 data points for each entry
- **HealthyTogether** (Chen and Pu, 2014)
 - 480 days of calories; 1440 data points for each day
- **E-Walk**
 - 236 people’s steps over a month; 30 data points for each person

Results

- SUMMARY:**
- We can obtain distinct and meaningful clusters of common activity routines
 - Specialized recommendations can be tailored for each common routine
